

Recount Text: My Experience Building a Portfolio Website

Orientation

Last month, I had a final project for my X PPLG class. The assignment was to create a personal portfolio website from scratch. It was my first time coding a complete website, so I felt both excited and nervous. The project was divided into 2 phases: design and coding.

Events

On April 14, 2026, I started Phase 1. I designed the UI/UX of my website using Figma. I chose blue and white as the main colors and made sure the layout looked clean. After my teacher approved the design, I moved to Phase 2 on April 22, 2026.

Coding was harder than I expected. The first problem was making the website responsive. When I opened it on my phone, the layout was completely broken. I also struggled with the Bootstrap navbar. It didn't work for two days because I forgot to add the JavaScript link. I fixed it after reading W3Schools and asking my friend for help.

Another challenge was the skill progress bar. To fill it, I used the percentage formula from my Math class: $\text{study hours} / \text{target}$

hours x 100%. I calculated 85% for HTML and 70% for CSS, then applied it to the CSS width.

On May 10, 2026, at 11 PM, my website finally ran without any errors. I felt so relieved and proud when I saw it go online. All my friends could access it through the link I shared.

Re-orientation

Overall, this project taught me many valuable lessons. I learned to be patient when debugging, the importance of reading documentation, and that coding requires a step-by-step process. Although my website is still simple, I am proud because I built it myself. In the future, I want to learn JavaScript to make my website more interactivited
